**COMPREHENSION**

Read the passage given below and answer the questions that follow. Circle the letter of the best answer.

Spiders are small animals. They are not insects, and very few of them can sting or bite us. A spider has two body parts. Insects have three body parts. Most spiders have eight legs, but insects have six.

If a baby spider loses one leg, it can grow a new one but an adult spider cannot grow a new leg. All spiders grow from eggs. The female spider lays the eggs. Some female spiders lay as many eggs as a thousand eggs at a time. Each egg is as small as a tiny seed. The eggs hatch into baby spiders. Baby spiders are surprisingly small.

Spiders have a hard skeleton on the outside of their bodies. As the spider gets bigger, it leaves its skeleton and grows a new one. While its new shell is growing, other animals can easily eat it. Sometimes a spider gets stuck when it tries to leave its skeleton. If this happens, the spider will die.

Most male spiders are smaller than female spiders. Some female spiders kill male spiders. If they are hungry, they have the male ones for lunch!

Spiders help us. Insects are sometimes pests, but spiders kill them. Spiders are special animals.
