#### PENANG SANGAM HIGH SCHOOL P.O.BOX 44, RAKIRAKI

#### **LESSON NOTES**

Year/Level: 11 C/D week 14 Subject: Chemistry

Strand	3 Reactions
Sub Strand	3.2 types of reactions
Content Learning Outcome	Distinguish and describe different types of reactions based on chemical statements and balanced chemical equations

## Other Examples of electrolysis

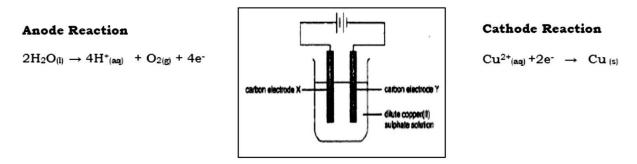

# 1. Electrolysis of molten Lead Bromide Using Carbon Electrodes

Lead bromide melts at 373°C to form molten lead bromide (PbBr<sub>2</sub>), which is made up of mobile lead ions and bromide ions. During electrolysis, lead ions are attracted to the cathode and are reduced to silver lead metal and bromide ions are attracted to the anode forming bromine, a red coloured gas.

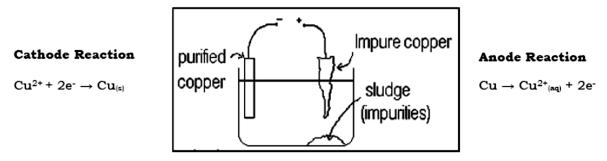

# Cathode Reaction Anode Reaction $Pb^{2+}_{(aq)} \ + \ 2e^- \rightarrow Pb_{(l)}$ $2Br_{(aq)} \rightarrow Br_{2(g)} \ + \ 2e^-$ Silver liquid red gas

#### 2. Electrolysis of Copper Sulphate solution Using Carbon

Copper sulphate solution contains the electrolytes; copper ions, sulphate ions and water. Copper ions are attracted to the cathode and are reduced to reddish brown copper metal. Sulphate ions are attracted to the anode. However, water is oxidised as sulphate ions cannot be oxidised. It releases oxygen gas, so a colourless gas is formed at the anode.

**3.** Electrolysis of Copper sulphate solution using copper metal electrodes This set up is used in the *industrial production of copper metal*. In the figure below, impure copper is the anode and pure copper is the cathode.

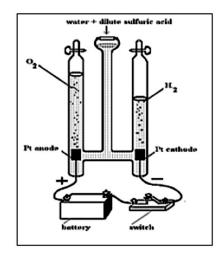

As the electricity is switched on, copper ions are attracted to the cathode and sulphate ions are attracted to the anode. At the cathode, copper ions are reduced to copper metal (reddish brown) deposited on the surface of the pure copper electrode. At the anode, copper is oxidised to copper ions and goes back to the copper sulphate solution. These ions replace the copper ions reduced at the cathode.

## 4. Electrolysis of water using carbon electrodes

Hydrogen gas is used as rocket fuel as it burns explosively (self-combust) in oxygen releasing a lot of energy. The product formed is water. The *Energy Industries* around are researching how it can be used as fuel for vehicles, especially buses as its product, water is environment friendly. The risk is the explosive nature of the reaction. Electrolysis of water is used industrially to produce hydrogen gas. Water reduced at the cathode produces hydrogen gas and water oxidised at the anode forms hydrogen ions.

 $2H_2O \rightarrow 4H^+_{(aq)} + O_{2(g)} + 4e$ 

Cathode Reaction

 $2H_2O + 2e^- \rightarrow H_{2(g)} + 2OH^-$ 

1. A concentrated solution of copper sulphate is used as the electrolyte in an electrolysis experiment.

a.V	Vhat	ions	are	present i	n the	e so	lution?				
b.	What	will	be	oxidized	at	the	anode,	water	or	sulphate	ions?
c.	What	will	be	reduced	at	the	cathode,	water	or	copper	ions?

- d. Write the balanced half-equations for the reactions at anode and cathode
- e. What observations would you make during the electrolysis experiment?
