Questions

1. What happens if your kidney stops working?

You will feel tired and weak because your body needs clean blood to function properly and you will need to undergo dialysis or kidney transplant.

2. Why do our bodies need air, food and liquid?

Our body uses most of these materials to grow and get energy.

3. What are the main excretory systems in our bodies and their functions?

Kidney filters liquid waste from our blood which is then passed to the bladder and later we pass it out as urine.

Liver also filters blood but its main work is to remove toxins or drugs from the blood stream before it reaches the brain.

STRAND	EARTH AND BEYOND
SUB STRAND	Soil
CONTENT LEARNING OUTCOME:	Identify different soil conservation practices.

LESSON NOTES

Agriculture Soil Conservation

Practice no till farming

- With no till farming, a crop is allowed to remain rather than being ploughed under at the end of the season. This practice keeps soil anchored in place instead of having bare ground exposed to wind and water.

Use terrace farming

- This type of farming uses the topography of the land to slow water flow through a series of terraces.
- This manipulation of the water prevents it from gathering speed and washing soil away from farmlands.

Practice contour farming

- Rather than planting crops in straight vertical rows, crops are planted following the contour of the landscape.
- Crops planted up and down hillsides create pathways for water to flow while crops planted parallel to the land slow the flow of water that prevents soil erosion.

ACTIVITIES

1. What is contour farming?
 - **Contour farming is the practice of tilling sloped land along lines of consistent elevation in order to conserve rainwater and to reduce soil loss from surface erosion.**
2. What is terrace farming?
 - **Terrace farming is a method of farming whereby steps known as terraces are built onto the slopes of hills and mountains to be used for crop cultivation.**
